Druckguss- und Kunststofftechnik

cleaning of cartridge filter

With increasing contamination of cartridge filters, the flow rate continues to decrease. This causes a changing thermoregulation and affects the overall process. After completing the 3-stage cleaning and testing process developed by FIMRO, the cartridge filters have almost the same quality level as a new filter. Since an optical test does not provide sufficient information on the actual permeability, a final flow measurement is carried out.

- extending of the lifetime of a filter cartridge
- reduction of spare parts costs
- careful testing and cleaning by FIMRO specialized staff
- Logging of the achieved filter capacity in l / min
- Multiple filter cleaning possible
- Cleaning of different brands / manufacturers
